

# B User Manual

For Analysts & Principal Fund Managers

Internal analytical tool — not investment advice. Document version 1.0 · July 2026

**Who this is for.** This manual covers day-to-day use of the BRB NGX Analyst platform for two roles: the **Analyst** (research, screening, portfolio construction and management, AI-assisted review) and the **Principal Fund Manager (PFM)** (everything an analyst can do, plus reviewing and approving rebalancing proposals). Administrator-only functions (user & API-key management) are summarised at the end. A separate *Deployment Guide* exists for the engineering team.

## Contents

1. Getting started & roles
2. Navigating the platform
3. Market Dashboard
4. AI Daily Market Summary
5. Stock Analysis & AI filing extraction
6. Screener
7. Watchlists
8. Bonds & ETFs (Instruments)
9. Building a portfolio
10. Managing a portfolio
11. AI Portfolio Review
12. Rebalancing & PFM approval workflow
13. Forecasting
14. Notifications, exports & theme
15. Analyst quick-start · PFM quick-start
16. Compliance reminders
17. Administrator functions

## 1 • Getting started & roles

Open the platform URL provided by your administrator and sign in with your work email and password. If you do not have an account, ask an administrator to create one for you.

| ROLE           | WHAT IT CAN DO                                                                                                                                      |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Analyst</b> | Research the market, screen equities, build and manage model portfolios, run AI reviews, set alerts, export data. Sees and owns its own portfolios. |
| <b>PFM</b>     | Everything an analyst can do, <b>plus</b> the Approvals queue: review, approve or reject rebalancing proposals submitted by analysts.               |
| <b>Admin</b>   | Everything, plus user management, API-key configuration, quota & audit dashboards. Sees all analysts' portfolios.                                   |

**First login.** Change your password is managed by an administrator. If your firm is still using the seeded demo accounts ( `analyst@brb.local` , `pm@brb.local` , `admin@brb.local` ), ask engineering to rotate them before real use.

## 2 • Navigating the platform

The top navigation bar gives you: **Dashboard**, **Stocks**, **Screener**, **Portfolios**, **Watchlists**, **Instruments** and **Forecasting**. On the right you'll find the notification bell, a light/dark theme toggle, and your user menu (name, role, sign out). PFMs also see an approvals icon; admins see a settings gear.

The platform opens in **dark mode** by default; use the sun/moon toggle to switch. Your choice is remembered.

## 3 • Market Dashboard

The landing page is your NGX daily overview. It has two tabs: **Market Overview** and **AI Daily Summary**.

Market Overview shows:

- **Market status banner** — open/closed and next session time (Africa/Lagos).
- **All-Share Index hero** — level, day change, YTD, deals, volume, value traded, total market cap, and breadth (advancers / decliners / unchanged).
- **Indices strip** — NGX30, NGX50, sector and thematic indices.
- **Most Active** (by naira value traded) and **FX** (naira exchange rates).
- **Movers**, **YTD performers**, and **Sector performance**.

**Derived data.** Where your data plan does not include an aggregate directly (e.g. sector performance or YTD leaders), the platform reconstructs it *exactly* from the underlying constituent list and labels it "derived from constituents (equal-weighted)". These are real calculations, not estimates.

All prices carry an "as of" timestamp and are delayed up to 20 minutes during NGX hours (last close otherwise).

## 4 • AI Daily Market Summary

On the Dashboard, open the **AI Daily Summary** tab and click *Generate today's summary*. Claude reads the day's snapshot, movers, sectors and FX and writes a desk-style briefing (headline, market action, movers & sectors, FX, takeaway). One summary is kept per trading day; use *Regenerate* to refresh it.

- **Include web context (cited)** — tick this to let Claude run up to three web searches for qualitative context (policy, corporate events). Sources are cited; NGX figures always come from the platform's own data, never the web.

**Compliance.** The summary is descriptive market commentary for internal use — not investment advice, a recommendation, or a prediction. Verify figures against the dashboard before relying on them.

## 5 • Stock Analysis & AI filing extraction

---

Go to **Stocks**, search a ticker or company name, and open its analysis page. Tabs cover the quote and chart, fundamentals and headline ratios, peers, dividends, and news.

### AI statement extraction

On the **Fundamentals** tab, the *AI statement extraction* panel lists the company's official NGX "Financial Statements" filings. Click *Extract with Claude* and the platform downloads the official filing PDF and extracts the income statement, balance sheet and cash flow as clean tables, with **page-level citations** back to the source document. Each extraction is cached; use *Re-extract* to refresh.

**Always traceable.** Every extracted figure carries a [p.N] marker pointing at the page of the filing, and the source PDF is one click away. Verify against the PDF before relying on the numbers.

## 6 • Screener

---

Under **Screener**, filter the NGX universe by search term, sector and market-cap band, and sort by any column (price, day, 1-month, YTD, 52-week). Useful workflows:

- **Save preset** — store a filter/sort combination to reuse later.
- **Select rows** → **push to portfolio** — tick companies and send them straight into a new portfolio draft.
- **CSV** — export the current result set.

## 7 • Watchlists

---

Under **Watchlists**, create named lists and add tickers (there is a "watch" control on each stock page). A watchlist shows mini price charts and aggregated news for its members — a lightweight way to monitor names you are researching before they enter a portfolio.

## 8 • Bonds & ETFs (Instruments)

---

**Instruments** has Bonds and ETFs tabs: searchable, filterable tables with coupon, maturity, issuer (bonds) and price/day/YTD (ETFs), each exportable to CSV. Click an ETF to open its detail page with a price chart.

## 9 • Building a portfolio

Go to **Portfolios** → **New portfolio** (or arrive here from the screener's "push to portfolio"). In the builder you:

- 1 Name the portfolio, set a benchmark (e.g. ASI) and base currency, and add mandate notes (these guide the AI review).
- 2 Add holdings by ticker. Choose **weight mode** (target %) or **units mode** (share counts), and set an entry price.
- 3 Watch the live validation (weights summing to 100%, warnings on concentration) and save.

On save, the platform computes portfolio analytics (weighted ratios, sector allocation) so the model is ready to manage.

## 10 • Managing a portfolio

Open a portfolio and click through to its management view. The masthead shows market value, day change, unrealised and realised P&L, dividends and benchmark, with an NGN/USD toggle. Tabs:

| TAB          | PURPOSE                                                                                                                                                       |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Holdings     | Live positions: units, average cost, current price, market value, day move, unrealised P&L, and weight vs target (drift).                                     |
| Transactions | The ledger. Record buys, sells and dividends (holiday-aware date picker). Positions and cost basis are computed from this ledger.                             |
| Rebalancing  | Compares current weights to targets and proposes trades to close the gap. Submit for PFM approval from here.                                                  |
| Performance  | Time-weighted return proxy vs benchmark, and contribution by holding.                                                                                         |
| Risk         | Beta, alpha, volatility, tracking error, information ratio, Sharpe/Sortino (editable risk-free), historical VaR/CVaR, max drawdown, and a correlation matrix. |
| AI Review    | Claude-powered optimisation ideas (see next section).                                                                                                         |
| Alerts       | Price and ex-dividend alerts for the portfolio's names.                                                                                                       |

## 11 • AI Portfolio Review

The **AI Review** tab is the platform's flagship analytical assistant. It reads your live holdings plus the current NGX opportunity set and proposes concrete optimisation ideas.

- 1 Enter the **cash available to trade (H)** — your dry powder to deploy.
- 2 Click *Generate review*. Claude analyses concentration, sector tilt, momentum and P&L against your mandate.
- 3 Read the output: **Portfolio Diagnosis**, **Ideas to Trim or Exit**, **Ideas to Add** (names from the live opportunity set, sized in H), an **Illustrative Reallocation Plan** that reconciles cash + trim proceeds against the adds, **Risks**, and a **Compliance note**.

**How it stays honest.** The review uses only the figures the platform provides — it never invents prices or fundamentals. Sizing is explicit arithmetic (units × price). It flags single names above ~15% of the book and sizes new adds prudently.

**These are ideas, not orders.** The AI review is internal decision-support for your judgement. Validate every figure, then route any resulting trades through the Rebalancing tab for PFM/IC approval. Not investment advice.

## 12 • Rebalancing & the PFM approval workflow

---

The platform enforces a two-person control on rebalancing:

### Analyst

- 1 On the **Rebalancing** tab, review the proposed trades to move current weights toward target.
- 2 Click **Submit for PFM approval**. The proposal enters the approvals queue and is recorded in the audit trail.

### PFM

- 1 Open the **Approvals** queue (clipboard icon in the top bar, or the Approvals page).
- 2 Review each pending proposal's trades and rationale.
- 3 **Approve** or **Reject**. The decision is logged and the analyst is notified.

**Separation of duties.** An analyst cannot approve their own proposal; only PFMs and admins can act on the queue. Every submission and decision is written to the audit trail.

## 13 • Forecasting

---

**Forecasting** provides illustrative scenario tools: a Monte-Carlo price forecast with confidence bands, a fundamental scenario builder, a dividend forecast, and a macro view. Forecasts are **illustrative scenarios, not predictions**, and are labelled as such throughout.

## 14 · Notifications, exports & theme

---

- **Notifications** — the bell shows triggered price and ex-dividend alerts. Use "check now" to evaluate immediately, and "mark all read".
- **Exports** — most tables offer CSV; analysis pages offer PNG chart export and a print-ready PDF one-pager (browser print).
- **Theme** — dark by default; toggle to light with the sun/moon icon.

## 15 • Quick-start workflows

---

### Analyst — daily research to proposal

- 1 Open the **Dashboard**; skim the AI Daily Summary for the market tone.
- 2 Use the **Screener** to shortlist names; save a preset; push interesting ones to a portfolio draft or a watchlist.
- 3 Deep-dive candidates on **Stocks**; extract the latest filings on the Fundamentals tab.
- 4 In **Portfolios**, open your book and run an **AI Review** with your available cash.
- 5 Take the accepted ideas to the **Rebalancing** tab and **Submit for PFM approval**.

### PFM — oversight & approval

- 1 Check the **Approvals** queue for pending proposals.
- 2 Open each portfolio's **Risk** and **Performance** tabs to sanity-check the book.
- 3 Review the proposed trades and rationale; **Approve** or **Reject**.
- 4 Use the **AI Review** yourself to pressure-test an analyst's thesis before deciding.

## 16 • Compliance reminders

---

- The platform is an **internal analytical tool** — nothing it produces is investment advice or a client recommendation.
- AI outputs (summaries, filing extractions, portfolio reviews) are **decision-support** for a professional's judgement. Verify figures against source data.
- Forecasts are **illustrative scenarios**, never guarantees. No output implies guaranteed returns.
- Prices are delayed up to 20 minutes during NGX hours. Past performance does not indicate future results.
- Rebalancing output requires PFM/IC approval and is never an order.

## 17 • Administrator functions (reference)

---

Admins have a **settings gear** in the top bar opening the Admin page:

- **Users & roles** — create staff accounts (Analyst, PFM, Admin), change roles, reset passwords, remove users. The last administrator cannot be removed or demoted.
- **API keys** — configure the NGN Market and Claude API keys in-app; they are encrypted at rest and take effect immediately.
- **Quota & audit** — API usage against the monthly pool, recent requests, and the full audit trail of analyst actions.
